**Conclusions and Recommendations**

1. The FRMP forest inventory of the Coastal Plantations has generated the desired results as evidenced by the sampling errors of the tree volume and other estimates. The sampling errors of the volume estimates (V10, down to 10-cm diameter, underbark) are 7.1% for Noakhali and 10.5%, 10.7% and 18.3% for Bhola, Patuakhali and Chittagong C/A, respectively. The sampling errors of the total volume (TVOL: stem volume plus crown volume) are slightly lower/better than the above numbers. The precision of the estimates is well within the target of about 10% but not more than 20% sampling error for the divisional volume estimates as prescribed in the sampling design phase of the forest inventory sub-component of FRMP. The sampling errors at the stratum and species levels, at least for the important stratum (10 years or older stands) and species (Keora), generally about 7 to 10% (about 17% in Chittagong C/A), are also well within the designed target of 20% sampling error. In the case of the four C/A Divisions, to increase the precision of estimates to a sampling error of 5% at the division level would have required more than twice the time and resources available for the job. Based on these considerations, it is concluded that the statistics presented in this report are adequate for forest management planning of the C/A Divisions.
2. The Coastal plantations have increased in area since the last photography (1984) and forest inventory (1984-1987): more than five times in Noakhali, about six times in Chittagong C/A, about 3.5 times in Bhola and about 2.5 times in Patuakhali (based on the FRMP RIMS-GIS database and the 1987 forest inventory report of FAO UNDP BGD/85/085). But, the stocking per ha has decreased particularly in Chittagong C/A Division where the total area of plantations has increased six times but the total volume of trees has increased only about 1.9 times. In Noakhali, the increase in tree volume is about 5.2 times compared to about 5.6 times increase in area; in Bhola, 1.6 times increase in total volume as

---

<sup>1</sup> All programming tasks were done by Delwar Hossain, Computer Programmer, FRMP-TA except the first prototype of DEVP which was programmed by A. Revilla.

against 3.5 times increase in area; and in Patuakhali, 2.3 times increase in total volume versus 2.5 times increase in area. Clearly, the situation in Chittagong C/A needs some drastic measures if the plantations are to be maintained at higher levels of stocking. While stocking varied from 10 to 60 cu.m./ha in Chittagong C/A in 1984, the NRMP inventory shows only about 4.0 cu.m./ha (5-cm dbh+ trees/poles). The same observation and recommendation also apply in the case of Bhola.

The following figures summarize the levels of stocking in the four C/A Divisions.

Coastal Division	NT/ha, 10-cm dbh+	TVOL/ha, 10-cm dbh+	Poles/ha, 2.5–10cm dbh	Saplings per ha	Seedlings per ha
Noakhali	361	31	1864	3152	13360
Chittagong	69	3	738	2202	15228
Bhola	193	17	551	186	641
Patuakhali	217	48	572	967	5840

3. A significant number of trees in the older plantations, particularly those that are more than 20 years old, were observed to be dead or dying. The number can be as high as 20 to 30% in some places. This observation partly explains the decrease in the average volume stocking of the plantations over the last 12 years. This observation also suggests the need to consider a management strategy to utilize some of these resources before they die and rot. This should of course be done in line with the protective services of the forest plantations against cyclones and the issue on land ownership over these areas.
4. A **continuing resources change assessment system** (CRCAS) for the C/A plantations is also hereby recommended. CRCAS must be designed, supported and implemented to provide timely (at least annually) resource change statistics for the Forest Managers, the Leaders and people to respond effectively to any aggravating circumstances. The basic components of CRCAS has now been set in place by FRMP at the RIMS/GIS Wing of FD. What are needed are: a) staff to operate and maintain the system, b) annual field check/enumeration/measurement of one-tenth to one-fifth of the 20" by 20" grid plot clusters so that all plot clusters would have been re-visited/re-enumerated in five to 10 years, c) annual/biennial acquisition of appropriate satellite imageries covering portions (sensitive portions) of the C/A plantations to detect resource change, d) ground monitoring system to check areas identified on the satellite imagery to have unusual activities/changes, and e) RIMS/GIS personnel to conduct necessary studies including strategic studies to manage and conserve the C/A plantations for the maximum benefit of the people of Bangladesh.

### Scope and Objectives of the Forest Inventory Sub-Component of FRMP

The FRMP forest inventory sub-component covers eight Forest Divisions, namely: the Sundarbans Reserved Forest, Sylhet, Chittagong, Cox's Bazar, Noakhali C/A, Chittagong C/A, Patuakhali C/A and Bhola C/A Forest Divisions. As indicated in the sampling design specifications of these forest inventories, the objectives of the FRMP inventories are threefold. The primary objective is to generate information on the

standing timber and other resources (bamboo, rattan, nipa and medicinal plants) for integrated forest management planning purposes. The second objective is to provide abstract time-series data, whenever possible, for plantation yield modeling purposes. And, the third objective is to set up or at least provide a basis for setting up a system of "hidden" recurrent sample plots for continuous monitoring and assessment of change in the target forest areas.

### **Target Precision, Sample Size (No. of Plots) and Sample Plot Configuration**

**Target precision.** - The FRMP forest inventories, except for the C/A plantations, were designed to attain a precision of the estimates of not greater than 5% sampling error based on the volume of trees/ha in each division, not more than 10 to 15% sampling error for each of the more important strata, and not more than 20% sampling error for the other strata. In the case of the C/A plantations, these precision levels were somewhat compromised/relaxed to 10% sampling error of the volume estimate at the Division level but the 20% maximum sampling error was maintained at least for the important strata (10 years or older plantations) and major species (Keora). These precision levels are considered adequate for forest management planning purposes.

**Sample size, n, for the C/A plantations.** – There were no available information on the coefficient of variation of tree volume statistics on the C/A plantations. Sampling errors for various strata are given in the 1987 report of the FAO/UNDP Project BGD/85/085 but the number of plots were not reported hence it was not possible to estimate the coefficient of variation upon which to base the sample size (no. of plots/plot clusters). Moreover, the plantations have changed over the years. Thus, the sample size question was approached by considering at least three alternative grids for a systematic sample, namely, 20"x20", 40"x20" and 40"x40". After a brief field visit to the plantations in Noakhali, it was estimated that a 40"x20" systematic sample grid would yield a precision of the volume estimates of not more than 5% sampling error for the four C/A Divisions combined. But, then the forest inventory of the C/A Divisions is required to provide adequate timber resources information for management planning at the Division level, hence, the 20"x20" systematic sample grid was decided upon which was estimated to yield a sampling error of 10% to 15% at the individual Division level, and about 10 to 20% sampling error for the important stratum and species. The 20"x20" systematic sample grid called for the enumeration of some 716 plot clusters in Noakhali, 374 in Chittagong C/A, 328 in Bhola and 293 in Patuakhali based on the available information on areas of plantations in the four Divisions. The planned sample size and the number of plot clusters actually enumerated in each Division are as follows.

C/A Division	Est. Area, ha, up to 1992	Planned sample size, n	No. of Plot Clusters, actual	Area as per RIMS-GIS, ha
Noakhali	24027	716	289	34223.2
Chittagong C/A	12535	374	408	20042.1
Bhola	11022	328	225	12420.3
Patuakhali	9835	293	168	9848.1

The planned sample size was not attained in actual field sampling because of the lack of time and trained manpower. Nevertheless, the results of the forest inventory of the C/A plantations are not too far from the prescribed precision of estimates.

**Sample plot configuration.** – The “sample plot” adopted for the FRMP forest inventories is a **cluster of five plots** where a “plot” is actually a set of sub-plots, one sub-plot each for seedlings (1-m radius), saplings (2-m radius), poles (5-m radius), and trees (11-m radius in the case of the C/A plantations. The five plots in the plot cluster for tree species in the C/A plantations (also in the Sundarbans Reserved Forest) are spaced 50 meters apart reckoned from the center plot along the cardinal directions.

The details of the sampling design specifications can be found in the first fielding report of the Forest Inventory Specialist (June 1995).

### Field Sampling

A sample of the Field Data Enumeration Form for the C/A plantations (and SRF) is given in Appendix 1. The field sampling procedures and instructions are contained in the second report of the FIS (July 1995). These procedures/instructions were refined during the training of the field sampling crews starting with the ACFs in October 1995. The codes for the plot and tree description variables and codes for trees and other species are shown in Appendices 2 and 3, respectively.

Field sampling started after the field crews had been trained in the respective Divisions, in October 1996 in the case of the Coastal Afforestation Divisions. All regular field enumeration activities were completed in May 1997. Field sampling activities were under the direct supervision of the DFO-MPD (Khulna).

### Data Entry and Validation

Data entry and initial validation for the C/A Divisions was scheduled to start as soon the field data sheets arrived in Khulna. Data entry and validation for the other Forest Divisions started after the field work season in 1996. To meet this schedule, the Data Entry and Validation Program (DEVP) was designed starting in December 1995 and programming was scheduled in early 1996. The first prototype of DEVP was ready in May 1996 as scheduled. The structure and technical specifications of the dbf tables and DEVP are indicated in Appendix 4. The details are given in Annex 1 of the FIS' report for his second mission (May 1996).

All data entry and initial validation activities were completed by the Forest Divisions in September 1997. These activities were also under the direct supervision of the respective DFO-WP, by the DFO-WP (Khulna) in the case of the SRF and C/A Divisions.

## Tree Volume Equations Studies

A set of tree volume equations studies was planned for the Sundarbans specifically for Sundri, Gewa, Keora, Baen, Kankra, Dhundul, Passur and Goran including weight equations for Goran and Golpatta. Data collection were finally completed in October 1997 and the data were then entered into appropriate files and the computer program to extract the information needed to derive the tree volume equations was developed and written. These studies were finally completed in January 1998 (Appendix 5) and have been used to generate the final volume statistics for the Sundarbans and C/A plantations. The new equations have been found to be more efficient than the ones used by ODA in the 1984 forest inventory of the Sundarbans. These equations were also used to generate the C/A forest statistics in the absence of more efficient equations for these plantations.

### Data Processing

**The Field Data Processing Program (FDPP).** - Design of FDPP started in early 1996 and the technical specifications, flow charts and algorithms were ready in May 1996 to guide the Programmer in encoding FDPP. The draft of the details of the design and technical specifications are contained in Annex 2 of the FIS' report for his second mission (May 1996). The final revisions/refinements are given in the revised version of the same document prepared and submitted in October 1997.

Programming started before July 1996 and individual modules were tested as soon as they were finished. Debugging and refinements continued to be made until the Sylhet and Sundarbans databases were received for final validation and processing.

**Final data validation.** – Final validation of the four databases were done as soon as the data sets were received for processing. Identification of the stratum of each plot cluster as determined on the GIS vegetative cover maps also had to wait for completion of digital mapping of the C/A Divisions. The maps of the C/A Divisions were completed only recently.

Of the plot clusters enumerated for the C/A Divisions, 288, 400, 223 and 161 were found valid for final processing for Noakhali, Chittagong C/A, Bhola and Patuakhali, respectively.

**The final strata and species/group.** – In the case of the C/A plantations, only two strata and two species/group were considered in the generation of the forest statistics. The strata are: "Planted up to 1986/natural stand" and "Planted after 1986". The species/group classes are: Keora and Others.

**Data processing.** – After the location coordinates and respective stratum of the plot clusters were validated, data processing of these data sets was done to generate the stand and stock tables for trees 15-cm DBH and bigger, poles, saplings and seedlings. Both the per hectare and total forest statistics for each Division were generated in the case of V10 (volume down to 10-cm diameter, underbark). Only the per ha values were printed and reported here for the VTOT (total bole and crown volume) estimates.

**The forest area statistics.** – Table 1 shows the areas of the C/A plantations by stratum and forest range for the four Divisions. As of the latest RIMS-GIS database, there are more than 34,200 ha of plantations in Noakhali, 20,000 ha in Chittagong C/A, 12,400 ha in Bhola (Barisal) and 9,800 ha in Patuakhali. Table 2 gives the distribution of the field sample plot clusters by range.

**Trees and regeneration.** - Table 3 summarizes the tree statistics including poles, saplings and seedlings. The sampling errors of the various estimates are also indicated in Table 3. Chittagong C/A and Bhola present a gloomy picture in terms of plantation stocking. Chittagong C/A, on the average, has only about 10 trees/ha or about 1.0 cu.m. (V10)/ha of trees in its plantations, but it has about 738 poles (2.5 to 15-cm DBH), more than 2000 saplings and 15000 seedlings per ha. On the other hand, Bhola has about 58 trees or 9.3 cu.m./ha, about 550 poles but very few regeneration, only has about 186 saplings and 640 seedlings per ha. The detailed stand and stock tables (per hectare values): number of trees, basal area, V10 for trees with 15-cm or bigger DBH, VTOT for 10 to 15-cm DBH trees, and number of small poles (2.5 to 10-cm DBH), saplings and seedlings are given in Appendix 6. The total divisional estimates are also detailed in Appendix 6. The per hectare estimates for VTOT are given in Appendix 7 while the non-merchantable volumes are shown in Appendix 8.

In summary, there are about 1.1 million cu.m. (VTOT) of wood in the C/A plantations of Noakhali, about 60% of which are in merchantable volume (V10). The corresponding estimates for Chittagong C/A, Bhola and Patuakhali are: 80,000 cu.m. (VTOT) or 20,000 cu.m. (V10), about 220,000 cu.m. (VTOT) or 115,000 cu.m. (V10), and about 480,000 cu.m. (VTOT) or about 350,000 cu.m. (V10), respectively. In terms of non-merchantable volumes, there are about 6.00 cu.m./ha in Noakhali, 0.47 in Chittagong C/A, 2.95 in Bhola and 8.65 in Patuakhali.

### The Confidence Limits

**Confidence limits of stratum mean.** - The 95% confidence limits of the stratum mean,  $\bar{x}_h$ , is given by the familiar expression:

$$\bar{x}_h \pm t^* s_e$$

where:  $t$  is the t-value at 5% with degrees of freedom,  $nh-1$  (where  $nh$  is the sample size of stratum  $h$ ) and  $s_e$  is the standard error of the stratum mean.

**Confidence limits of the population mean.** - The 95% confidence limits of the population mean,  $\bar{x}_{\text{pop}}$ , in stratified sampling is more complicated than the usual procedure specifically in determining its effective degrees of freedom,  $ne$ .

$$\bar{x}_{\text{pop}} \pm t^* s_{\text{ed}}$$

where:  $t$  is the t-value at 5% level with degrees of freedom  $ne$  and  $s_{\text{ed}}$  is the standard error of the population mean;  $ne$  is given by the following expression (From: Cochran).

$$ne = (\sum Gh^*Sh^2)^2 / \sum(Gh^2*Sh^4/(nh-1))$$

where:  $Gh = Nh^*(Nh-nh)/nh$ ,

$Sh^2$  is the sample variance of stratum  $h$ ,

$Nh$  is the size of stratum  $h$ ,

$nh$  is the sample size for stratum  $h$ , and

$Nh$  and  $nh$  are in the same units, e.g. ha.

Table 5 shows the computation of the effective degrees of freedom,  $ne$ , based on V10. In all cases in the four C/A Divisions, the effective degrees of freedom of the V10 estimates is more than 120, hence, the corresponding t-value to establish the 95% confidence interval is 1.96. The 95% confidence interval of the V10/ha estimates for the four C/A Divisions are, therefore, as follows.

Noakhali:  $17.44 - 1.96*1.238$  to  $17.44 + 1.96*1.238$  or **15.01 to 19.87 cu.m./ha**

Chittagong C/A:  $1.02 - 0.36$  to  $1.02 + 0.36$  or **0.66 to 1.38 cu.m./ha**

Bhola:  $9.31 - 1.91$  to  $9.31 + 1.91$  or **7.40 to 11.22 cu.m./ha**

Patuakhali:  $36.40 - 7.63$  to  $36.40 + 7.63$  or **28.77 to 44.03 cu.m./ha**

### Assessment of Change in the Forest Resources

From the last photography in 1984 and the last inventory in 1987 (Drigo, et al, 1987. FAO/UNDP BGD/85/085) to the FRMP forest inventory and mapping in 1994 to 1997, there have been significant changes in the C/A plantations. The available information on forest resources change in these areas is summarized in Table 4.

The Coastal plantations have increased in area over the 12-year period: more than five times in Noakhali, about six times in Chittagong C/A, about 3.5 times in Bhola and about 2.5 times in Patuakhali (based on the FRMP RIMS-GIS database and FAO 1987 forest inventory report). But, the stocking per ha has decreased particularly in Chittagong C/A Division where the total area of plantations has increased six times but the total volume of trees has increased only about 1.9 times. In Noakhali, the increase in tree volume is about 5.2 times compared to about 5.6 times increase in area; in Bhola, 1.6 times increase in total volume as against 3.5 times increase in area; and in Patuakhali, 2.3 times increase in total volume versus 2.5 times increase in area. Clearly, the situation in Chittagong C/A needs some drastic measures if the plantations are to be maintained at higher levels of stocking. While stocking varied from 10 to 60 cu.m./ha in Chittagong C/A in 1984, the NRMP inventory shows only about 4.0 cu.m./ha (5-cm dbh+ trees/poles).

BANGLADESH FRM&P FOREST INVENTORY

ENRICHMENT MANGROVE FOREST AND COASTAL PLANTATIONS

## Appendix 2. Plot and Tree Description Codes

**PLOT/TREE DESCRIPTION CODES**  
**(Mangrove Forest and Coastal Plantations)**

<u>Land use category</u>	<u>Stand Condition:</u>
1 Tidal forest	<u>Mangrove forest</u>
2 Coastal forest	1 Harvested, less than 5 years ago
3 Natural hill forest	2 Harvested, 5 or more years ago
4 Forest plantation	
5 Bush/shrubland	<u>Nipa forest</u>
6 Fruit/other trees	1 Newly harvested
7 Agriculture	2 Harvested, more than one year ago
8 No vegetation	3 Cleared
9 Settlement	
10 Others	<u>Forest plantations</u>
<hr/>	
	1 Well-stocked (at least 50% crown cover or of original stocking)
	2 Poorly stocked (< 50% crown cover or of original stocking)
1 Mangrove forest	3 Failure
2 Nipa forest	4 Destroyed by fire
3 Coastal forest	5 Eroded
6 Forest plantation	6 Encroached
	7 Handed over to Revenue Department

<b>Damage</b>	<b>Tree grade</b>
0 No damage	1 Straight and clean without damage, circular cross-section, apparently sound
1 Slight damage, tree will survive	2 Similar to 1 but up to half of surface is knotty or cross-section is irregular, or with slight sweep
2 Heavy damage, tree will die	3 Twisted and knotty, or with other defects which reduce usable volume by up to 25%, such as rot, burn, physical damage, forks or bends
3 Uprooted	4 Very knotty and bent, or with defects which reduce usable volume by up to 25 to 50%
4 Felled	
5 Broken	5 Reject, with such defects that only less than 50% of volume is usable
6 Dead	
<hr/>	
<b>Infestation</b>	
0 No infestation	
1 Insect infestation	
2 Climbed by rattan	
3 Slightly infested with climbers	
4 Severely infested with climbers	
5 Infested with mistletoe ( <i>Loranthus</i> sp.)	
6 "Top dying" (die-back)	
7 Others

**Appendix 5.      The FRMP Tree Volume Equations for the  
Sundarbans and C/A Plantations**

Appendix 5. The FRMP Tree Volume Equations for the Sundarbans (Including Weight Equations for Goran and Golpatta)

**Notes:** The regression modeling procedures used to derive the following equations involved eliminating the heteroscedasticity (heterogeneous variance) problem in the data sets. It should be noted that the presence of heteroscedasticity in each of the data sets violates one of the basic assumptions of regression models. Tree volume equations derived by regression procedures with very high coefficient of determination can give very inefficient estimates if heteroscedasticity is not corrected in the data.

The following tree volume equations give better volume estimates than the ones used in the ODA forest inventory of the Sundarbans. The details of the comparisons are given in Appendix 11 (SRF FI Report).

In the following equations, **V10E** is the equation or estimated tree volume, including branches that are at least 2 m long, down to 10-cm diameter underbark; **VTOTE** is the total tree volume including bole volume and branch volume of wood that are at least 2 m long, down to 10-cm diameter underbark, and non-merchantable crown/branch volume, overbark; **BVCRE** is the bole volume, underbark, up to the crown point; and **VNME** is the non-merchantable volume, overbark. In all cases, **V10E = 0** if DBH is less than 10 cm.

Species/Code	FRMP Equations
Sundri ( <i>Heritiera fomes</i> ) 228	$V10E = -0.02363 + 0.00001800*D2H + 0.0002210*D2$ $VTOTE = 0.008298 + 0.00001529*D2H + 0.0003505*D2$ $BVCRE = -0.0044196 + 0.00001364*D2H + 0.0002378*D2$ $VNME = VTOTE - V10E$
Gewa ( <i>Excoecaria agallocha</i> ) 215	$V10E = 0.00003149*D2H$ $VTOTE = 0.00003797*D2H$ $BVCRE = 0.00003070*D2H$ $VNME = -0.005021 + 0.0001890*D2H$
Keora ( <i>Sonneratia apetala</i> ) 221	$V10E = -0.0083256 + 0.00003824*D2H - 0.0001201*D2$ $VTOTE = 0.00003848*D2H$ $BVCRE = 0.000002284*D2H + 0.0001526*D2H$ $VNME = 0.03426 + 0.000002895*D2H$
Baen ( <i>Avicennia officinalis</i> ) 203	$V10E = 0.00003704*D2H - 0.002267*D2H$ $VTOTE = 0.0002572*D2 + 0.00002387*D2H$ $BVCRE = 0.0057935 + 0.00002695*D2H$ $VNME = VTOTE - V10E$
Kankra ( <i>Bruguiera gymnorhiza</i> ) 219	$V10E = -0.01971 + 0.00003729*D2H$ $VTOTE = 0.00004555*D2H$ $BVCRE = 0.00006299*VTOTE$ $VNME = VTOTE - V10E$
Passur ( <i>Xylocarpus mekongensis</i> ) 224	$V10E = -0.01806 + 0.0001358*D2 + 0.00002695*D2H$ $VTOTE = 0.0002887*D2 + 0.0002752*D2H$ $BVCRE = 0.00002939*D2H$ $VNME = VTOTE - V10E$

Dhundul ( <i>Xylocarpus granatum</i> ) 211	$V10E = -0.008143 + 0.00003819*D2H$ $VTOTE = 0.00009118*D2H - 0.000004678*D2H^2$ $BVCRE = 0.007231 + 0.00002885*D2H$ $VNME = VTOTE - V10E$
Goran ( <i>Ceriops decandra</i> ) 216	$VOL = 0.001429 - 0.001111*D + 0.0004294*D^2$ $WT = 1.337 - 0.8816*D + 0.3876*D^2$
Golpatta ( <i>Nypa fruticans</i> ) 290	$ULME = -1.0802 + 1.4524*LM - 0.1081*LM^2$ $WT = -1.4555 + 1.1953*ULME$ Alternatively, $WT = -1.3734 + 0.8882*LM$

**Legend:** D2 = DBH<sup>2</sup>, where DBH is in cm.  
 H = total tree height in m.  
 D2H = D2\*H  
 D2H<sup>2</sup> = D2\*H<sup>2</sup>  
 Volumes are all in cu. m.  
 WT = weight in kg.  
 LM = length of leaf in m.  
 ULME = length of utilized/split leaf in m. as estimated by the equation

**Note:** For quick estimation of the non-merchantable volume of stands (not individual trees), the following percentages of the total volume may be used: Sundri – 8.6%; Gewa – 4.0%; Keora – 10.2%; Baen – 18.3%; Kankra – 10.5%; Passur – 14.6%; and Dhundul – 14.5%.

## **Appendix 6.**

**Detailed Stand and Stock Tables (No. of Trees/ha, BA/ha, V10/ha (Trees), Poles, Saplings and Seedlings/ha) and Detailed Tree Statistics for the C/A Plantations (Total No., BA and V10 of Trees, Total Poles, Saplings and Seedlings)**
