Md. Abdul Latif

INTRODUCTION

Sal (*Shorea robusta* Gaertn. f.) is a medium size tree growing naturally from Tarai in the north to the Maynamoti hills in the south. The species has been planted in the forests of Tangail, Mymensingh, Dinajpur and Sylhet of Bangladesh for its extensive uses. It was also experimentally planted in the forests of Chittagong and Cox's Bazar. The bole of the tree is tall and straight. It attains generally a height of 18 m to 30 m and a diameter of 50 cm to 70 cm (Troup, 1986). The wood is durable and of good quality and hence used extensively for building and construction purposes, railway sleepers, wagons, etc. The older sal plantations are now suitable for felling and to estimate the volume, volume tables are necessary for the species. Therefore, the present volume tables have been prepared for sal growing in the plantations of Bangladesh.

COLLECTION OF DATA

Data were collected from the standing trees of the plantations of 56 - 26 years old for Sylhet and 51 - 11 years old for Tangail and Mymensingh. The plantations were initially raised with a stocking of 2988

seedlings per hectare but at the time of data collection, there were approximately 500 - 1400 trees per hectare. Measurements on diameters at breast height (dbh), total height and diameters at 3.0 meters intervals from the ground level to the top end diameter of 10.0 cm overbark were taken. The bark thickness at each point of diameter measurements was also taken in two perpendicular directions to estimate the diameter under bark. A total of 499 trees were measured for the preparation of volume tables (Table 1). In addition to these, data were collected from a total of 85 trees for validating the selected regression equations.

COMPILATION OF DATA

The volumes of all the sections except the top and bottom portion were computed by using the mean cross-sectional area of the two ends of each section (smallian formula). The bottom section was assumed cylindrical. The top most section was assumed a cone and volume was computed as one third of the cylindrical volume of the portion. The top end diameter measurement for each tree was considered as the base

diameter of the cone. The volumes of the cone was ignored for estimation of under bark tree volumes. The individual tree volume was then estimated by summing up the volumes of each section of a tree. These individual tree volumes (V) were related to dbh (D) and total height (H) by regression analyses using various functions and transformations as required in the regression models.

COMPUTATION OF VOLUME FUNCTIONS

Multiple regression analyses were done to select the best suited equations. The following 10 equations were tried to select the best fitted one :

1. $V = b_0 + b_1 D$
2. $V = b_0 + b_1 D + b_2 D^2$
3. $V = b_0 + b_1 D^2$
4. $V = b_0 + b_1 D^2 H$
5. $V = b_0 + b_1 D^2 + b_2 H + b_3 D^2 H$
6. $V = b_0 + b_1 D^2 + b_2 DH + b_3 D^2 H$
7. $\log_e(V) = b_0 + b_1 \log_e(D)$
8. $\log_e(V) = b_0 + b_1 \log_e(D) + b_2 \log_e(H)$
9. $V/D^2 = b_0 + b_1 HD^2 + b_2 /H + b_3/D^2$
10. $V/D^2 = b_0 + b_1 /D^2 + b_2/H + b_3/D$

where, V , D and H are described as above, b_0 is the regression constant and b_i 's are regression coefficients. The logarithmic functions are to the base e .

The regression model of best fit were chosen based on small furnival index, high multiple coefficient of determination, low

mean sum of error squares and high F-Value.

Models were selected for estimation of total volume over bark and total volume under bark to a top end diameter of approximately 9.0 cm under bark. The selected equations were transformed for estimation of volume from girth at breast height (G). The equations were also converted for imperial units.

VALIDATION TEST PROCEDURE

The best suited regression equations were tested with a set of independent data on 85 trees collected and compiled in the same procedure. The actual volumes of these trees were collectively compared with the corresponding volumes predicted by the selected models. The independent tests for validation criteria were :

- i) The paired t - test (Dawkins, 1975) :

$$t = \frac{d}{S.E. (d)}$$

with $(n - 1)$ df at 0.05 level

where, d = Average of the difference of the pairs of the actual and the estimated volumes.

$S.E. (d)$ = Standard error of the average difference

n = Number of pairs.

The criterion of insignificant difference has been followed.

- ii) Regression analysis (Cox 1984) :

$$a) A - E = b_0 + b_1 E$$

$$b) A - E = b_0 + b_1 E + b_2 E^2$$

Where, A and E indicate the actual and the estimated volumes respectively.

The criterion of significant for F and t have been followed.

- iii) Absolute per cent deviation (% AD) :

$$\% AD = \frac{|\sum (A - E)|}{\sum A} \times 100$$

Where, A and E are the actual and the estimated total volumes respectively.

A % AD of less than 10 per cent of absolute deviation has been considered as a selection criteria.

- iv) (A - E) vs E plot :

Where, A = Actual volume

E = Estimated volume

Criterion : If the plot indicates horizontal band, the model is adequate.

- v) A vs E plot & regression

Criterion : The nearer the slope to 45° is the better.

RESULTS, AND DISCUSSIONS

The equations for total volume overbark and total volume underbark to a top end diameter of 9.0 cm underbark were selected. The mean sum of squares (MSE), coefficient of determination (R^2), F - value, and the Furnival Index (FI) of the selected equations are given in table 2.

The best selected and transformed/converted equations are given below :

METRIC UNITS

Total volume overbark (V_{mo}) for one way :

$$\log_e(V_{mo}) = - 9.1727759 + 2.5178944 \log_e(D)$$

$$\log_e(V_{mo}) = - 12.0554 + 2.5178944 \log_e(G)$$

Total volume underbark to a top end diameter of approximately 9.0 cm under-bark (V_{mu}) for one way :

$$V_{mu} = - 0.1011481 + 0.0006209 D^2$$

$$V_{mu} = - 0.1011481 + 0.0000629 G^2$$

Total volume overbark for two way :

$$\log_e(V_{mo}) = - 9.615639 + 2.033071 \log_e(D) + 0.7361229 \log_e(H)$$

$$\log_e(V_{mo}) = - 11.938881 + 2.033071 \log_e(G) + 0.7361229 \log_e(H)$$

Total volume underbark to a top end diameter of approximately 9.0 cm under bark (V_{mu}) for two way :

$$V_{mu} = 0.0032556 + 0.0000269 D^2 H$$

$$V_{mu} = 0.003255 + 0.0000027255 G^2 H$$

IMPERIAL UNITS

Total volume overbark (V_{io}) for one way :

$$\log_e(V_{io}) = - 3.2615386 + 2.5178944 \log_e(D)$$

$$\log_e(V_{io}) = - 6.1438476 + 2.5178944 \log_e(G)$$

Total volume underbark to a top end diameter of approximately 3.5 inches underbark (V_{iu}) for one way :

$$V_{iu} = - 3.5720185 + 0.14146622 D^2$$

$$V_{iu} = - 3.5720185 + 0.0143335 G^2$$

Total volume overbark (V_{io}) two way :

$$\log_e(V_{io}) = - 5.02669 + 2.033071 \log_e(D) + 0.7361229 \log_e(H)$$

$$\log_e(V_{iu}) = -7.3540131 + 2.033071 \log_e(G) + 0.7361229 \log_e(H)$$

Total volume underbark to a top end diameter of 3.5 inches underbark (V_{iu}) for two way :

$$V_{iu} = -0.11496 + 0.001867 D^2H$$

$$V_{iu} = -0.11496 + 0.0001894 G^2H$$

where, m = metric units

i = imperial units

u = underbark

o = overbark

D = Dbh

G = Girth at breast height

H = total height

Validation of the Selected Models

Models : The test statistics are presented in the table 3. The selected models satisfied all the criteria. The most vivid ones are the slopes and per cent total deviations. They are nearly 45 degree and less than 5% respectively. This nature was considered sufficient to mark the importance of little discrepancies in the horizontal bands of deviations. From the results of the validation of the models, it can be concluded that the selected models can be safely used for estimation of the volumes of the sal tree in the plantations of Bangladesh.

After the validation test, volume tables were prepared for ready use and are presented in Appendices I to VI.

CONFIDENCE LIMIT

These volume tables should not be used to determine volume of individual tree

in a stand. These tables may be used for the mean tree of a stand which may be multiplied by the number of stem to get the volume. Estimation of volumes for trees much out side the height and dbh ranges shown in the stand table should only be done with caution.

ACKNOWLEDGEMENT

The authors are thankful to Mr. Someswar Das, Conservator of Forests and formerly Chief Research Officer, Forest Management Branch of Bangladesh Forest Research Institute, Chittagong for his guidance in planning and collection of data and Mr. R. L. Banik, Chief Research Officer in-charge, Forest Management Branch of Bangladesh Forest Research Institute, Chittagong for his constructive suggestions to improve the presentation of the manuscript.
